

Turkey Partnership

Scope, Pricing & Timeline

Prepared for partner discussion

Confidential · Draft for review

Overview

VoiceBit is an AI phone agent for restaurants. This document sets out how we would enter the Turkish market in phases, what each phase costs, and what has to be confirmed before it can start.

Phase 0 works today. It is the product running in the United States right now and needs the least local adaptation, so it is where a partnership should begin. Phases 1 through 4 each add capability, and each depends on a local question we cannot answer from here: hardware sourcing, an SMS provider, a payment processor, and a delivery network.

Pricing for Phase 0 is set. Pricing for later phases moves with the local supplier costs, so those numbers are shown as ranges or marked for confirmation rather than guessed at.

The phases at a glance

Phase	What it adds	Depends on	Status
v0	AI answers calls and takes orders	Call forwarding only	Available now
v1	Kitchen printer and tablet	Local hardware sourcing	Discovery
v2	Order confirmation texts	Turkish SMS provider	Discovery
v3	Payment links and web ordering	Payment processor in Turkey	Discovery
v4	Delivery driver network	Local driver partner	Discovery

Each phase stands on its own. A restaurant can run on v0 indefinitely. Later phases are additive, so the partnership can stop at any point and still have a working product in market.

SCOPE

The restaurant forwards its existing phone line to VoiceBit. From there:

- The **AI answers the call** in the restaurant's name and takes the full order.
- The order is **pushed to the VoiceBit dashboard**, where staff see it live in any browser.
- If the caller **asks for a live agent**, the call is transferred to the restaurant.

Nothing changes for the customer. They call the same number they always have. No hardware is required and no integration with the restaurant's existing systems is needed.

WHAT IS NOT IN V0

No kitchen printer, no order confirmation texts, no online payment, and no delivery dispatch. Those arrive in v1 through v4.

PRICING

Tiered monthly plans based on AI talk time.

Plan	Included minutes	Monthly	Effective rate
Starter	up to 100	\$99	\$0.99 / min
Growth	up to 500	\$250	\$0.50 / min
Scale	up to 1,000	\$400	\$0.40 / min

Additional minutes beyond the plan allowance are billed at **\$0.99 per minute**. Restaurants consistently running above 1,000 minutes are quoted a custom plan rather than left on overage. All figures in USD; local currency pricing to be set with the partner.

TIMELINE

Step	Indicative duration
Agent build: menu, hours, greeting, Turkish language tuning	1 to 2 weeks
Phone number provisioning and call forwarding setup	A few days
Pilot with first restaurants, monitoring and tuning	2 to 4 weeks

To confirm before launch: Turkish language performance on real orders, telephony numbering and call-forwarding rules with local carriers, and whether the AI voice meets local expectations. We would want a small pilot before any wider rollout.

SCOPE

In the US, orders print on a thermal printer in the kitchen and appear on a tablet on the counter. The open question for Turkey is whether that hardware is needed at all, or whether restaurants can work from a dashboard on equipment they already own.

- **Option A, no hardware.** Staff use the VoiceBit dashboard on an existing device. Lowest cost, fastest to deploy.
- **Option B, hardware.** We supply a printer and tablet, the same as the US setup. Better for busy kitchens that cannot watch a screen.

WHAT WE NEED TO CONFIRM

- Do target restaurants already have a screen or POS the dashboard can run on?
- Can printers and tablets be sourced locally, and at what price including import duty?
- Is there an existing local POS or kitchen display we should integrate with instead?

PRICING

The monthly plan is unchanged from v0. Hardware is a one time cost on top.

Item	US price	Turkey
Thermal printer	\$150	To be confirmed
Tablet	\$150	To be confirmed
Monthly subscription	Unchanged from v0	

Hardware is sold at cost. We do not mark up devices in the US and would propose the same in Turkey. Local pricing depends on sourcing and duty.

TIMELINE

Two to four weeks once sourcing is settled, mostly procurement and testing a unit end to end before any restaurant receives one. If Option A works, this phase is effectively immediate.

SCOPE

After the AI takes an order, the customer receives a text confirming what was ordered and when it will be ready. In the US this is how customers verify the AI heard them correctly, and it is a large part of why they trust it.

We currently use **Twilio**. Whether Twilio is the right route in Turkey, or whether a local provider is required, is the open question.

WHAT WE NEED TO CONFIRM

- Do Turkish customers expect an order confirmation text, or is this unnecessary locally?
- Which provider can deliver reliably to Turkish mobile numbers, and at what per message cost?
- What are the local rules on sender registration, consent, and commercial messaging?

PRICING

The monthly plan may increase depending on the per message cost of the chosen provider. We would size this once a provider is selected, and would expect it to be a small addition rather than a change in the pricing structure.

Note: messaging rules differ meaningfully by country, including sender ID registration and consent requirements. This needs a local check before we commit to a price.

TIMELINE

Two to three weeks after a provider is chosen, allowing for sender registration, which is often the slowest step.

SCOPE

Payment links let the customer pay at the moment the order is placed, rather than on collection. This unlocks two things:

- **Prepaid orders.** The order is confirmed and paid before the kitchen starts it.
- **Delivery orders.** Delivery only works reliably when payment is captured up front, so this is the gate for taking delivery orders at all.

This phase also unlocks web ordering. Once payments work, the same checkout powers a commission free online ordering website for the restaurant, which is a second product to sell into the same customer base.

We currently use **Stripe**, and Stripe does support Turkey, so this may be the least difficult of the four phases.

WHAT WE NEED TO CONFIRM

- Can Turkish restaurants onboard to Stripe, including payouts to local bank accounts?
- What are the transaction fees, and are they passed to the restaurant or the customer?
- Is a local payment method expected that Stripe does not cover?

PRICING

Driven by transaction fees, which are confirmed once the processor is settled. In the US, card processing is charged per transaction and can be passed on to the customer. We would propose the same structure.

Component	Basis
Monthly subscription	Unchanged from v0
Card processing	Per transaction, rate to be confirmed for Turkey
Web ordering	Priced separately once payments are live

TIMELINE

Three to four weeks, covering processor onboarding, testing a live transaction and refund, and confirming payouts land correctly.

SCOPE

Once orders can be paid for online, they can also be dispatched. The aim is to connect to a driver network in Turkey and send delivery jobs to it automatically, so a restaurant can offer delivery without running its own fleet or paying marketplace commission.

In the US we work with several delivery providers and route each order to whichever can serve it. The same model would apply, using whichever local networks have an API we can dispatch to.

WHAT WE NEED TO CONFIRM

- Which driver networks operate in the target cities, and do they offer API dispatch?
- What does a delivery cost, and how does that vary by distance?
- Are restaurants currently paying marketplace commission we can undercut?

PRICING

To be determined after the driver networks are explored. In the US, delivery is billed per delivery based on the provider's cost plus a small platform fee, and can be passed to the customer at checkout.

This phase depends on v3. Without payment capture at the time of ordering, delivery is not practical.

TIMELINE

Four weeks or more, and highly dependent on the partner's integration. This is the least defined of the phases and should be scoped properly once v3 is live.

Pricing Summary

Phase	Recurring	One time / variable
v0 AI phone ordering	\$99 / \$250 / \$400 per month by tier	\$0.99 per additional minute
v1 Kitchen hardware	Unchanged	Printer and tablet at cost, \$150 each in the US
v2 Confirmation texts	Possible small increase	Per message cost, to be confirmed
v3 Payments and web	Unchanged, web priced separately	Card processing per transaction, to be confirmed
v4 Delivery	Unchanged	Per delivery, to be confirmed

Partner Revenue Share

VoiceBit shares **20% of recurring subscription revenue** with the partner for every restaurant in the partner's market, for as long as that restaurant stays subscribed.

Plan	Monthly price	Partner share (20%)	Per year
Starter, up to 100 minutes	\$99	\$19.80	\$237.60
Growth, up to 500 minutes	\$250	\$50.00	\$600.00
Scale, up to 1,000 minutes	\$400	\$80.00	\$960.00

Illustrative: 50 restaurants on the Growth plan would return **\$2,500 per month** to the partner, or \$30,000 per year, recurring for as long as those accounts stay live.

Recurring, not one time. The share applies every month the restaurant is subscribed, so the partner's income compounds as the base grows rather than resetting with each new sale.

The 20% applies to recurring subscription revenue. Treatment of hardware (sold at cost) and pass-through costs such as card processing and delivery fees is to be agreed as those phases are scoped.

Indicative Timeline

Phase	Starts when	Duration
v0	Immediately	2 to 4 weeks to first live restaurant
v1	Hardware question answered	2 to 4 weeks, or immediate if no hardware needed
v2	SMS provider selected	2 to 3 weeks
v3	Processor confirmed	3 to 4 weeks
v4	After v3 is live	4 weeks or more

Durations are working estimates for planning, not commitments. Each later phase depends on a local answer we do not have yet, and the discovery work is usually what sets the pace, not the build.

What We Need From You

The fastest way to move is to answer these, in roughly this order:

1. **Language and telephony.** Can we run a Turkish pilot, and what are the call forwarding rules with local carriers?
2. **Hardware.** Do restaurants have a usable screen already, or do we need to supply printers and tablets? What do they cost locally?
3. **Messaging.** Are confirmation texts expected, and which provider reaches Turkish mobiles reliably?
4. **Payments.** Can restaurants onboard to Stripe with local payouts, and at what transaction fee?
5. **Delivery.** Which driver networks operate locally and can they accept dispatch by API?

Recommended start: launch v0 with a small group of restaurants while the v1 to v4 questions are being answered in parallel. v0 needs the least local infrastructure, and a live pilot tells us more about the market than further planning will.
